

HAYLOVIC, V.

1275. AN IONIZATION ANEMOMETER FOR
BIOMETEOROLOGICAL MEASUREMENTS. V. Haylovic.
Slaboprudy Obzor, Vol. 18, No. 10, 712-15 (1957). In Czech.

The instrument consists of a sonde (or a probe) and bridge-type d.c. amplifier. The probe consists of two electrodes, one of which carries a radioactive source (α -rays). For unidirectional measurements, the electrodes of the probe are in the form of two parallel plates. The omnidirectional probe has a spherical source electrode and the collector electrode in the form of a spherical "cage" consisting of three rings. The source electrode is given a potential of +100 V and the current produced by the probe is measured across a 100 M Ω resistor which feeds into the amplifier. The instrument is also fitted with a small wind tunnel which is used for calibration purposes. Both probes have a linear velocity v. galvanometer-deflection response and can be used at velocities below 2m/s.

 Title : Observations on the Natural and Artificial Radio-
 active Aerosols in the Atmosphere During the
 Second Half of 1957
 Orig Pub. : Ceskoslov Hyg, 3, No 7, 391-401 (1958)
 Abstract : The authors present data on the diurnal variation
 of the concentration of Rn, Tn, and of artificial
 radioactive aerosols in the atmosphere during
 the second half of 1957. The determinations were
 made by a filtration procedure which is described
 in the article. The authors point to the high
 probability of a correlation between the sharp
 increase in the short-time radioactivity in the
 air over Pilsen and the accident at the British
 atomic reactor plant.

TITLE: Investigations of natural and artificial radioactive aerosols in the atmosphere in 1959-1960

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 2, 1962, 16, abstract 2B128 (Ceskosl. hyg., 6, no. 7, 1961, 411-418)

TEXT: The results of observations at Pilzen are presented. The unusually high radon concentration of 2.5×10^{-10} curies/m³ was noted in August-September 1959; this was related to the period of drought. The level of the atmosphere's artificial radioactivity fell in the course of 1959-1960, but maximum contents of long-life radioactivity were again recorded after the explosions in the Sahara. TITLE: Gamma spectra of the atmospheric fallout and age indexes after the cessation of nuclear tests

SOURCE: Jaderna energie, no. 2, 1965, 47-51

TOPIC TAGS: gamma ray, gamma spectroscopy, atmospheric property, radioactive fallout, managanese, strontium, isotope

ABSTRACT: Samples of atmospheric fallout in the years 1963 and 1964, in the period after the cessation of nuclear tests, were analyzed spectrometrically. The quantities of the individual nuclides in the mixture were determined from the spectra by absolute evaluation using comparative preparations and standards. ⁵⁴Mn was determined along with fission products with long half lives. At the same time, ⁹⁰Sr was determined radiochemically. In this way it was possible to make use of several age indexes and to determine approximately the age of stratospheric fallout from their half lives. Orig. art. has: 6 graphs, 5 formulas.

TITLE: An apparatus for the collection of samples of aerosols on membrane filters

SOURCE: Jaderna energie, no. 3, 1965, 102-103

TOPIC TAGS: radioactive fallout, industrial filter, aerosol chemistry

ABSTRACT: The apparatus uses a membrane filter with a pore size 1.2μ . Curves are given showing flow rate and pressure drop as a function of time. Results of collections of activity from June 1963 through June 1964 are shown. These data were used to calculate the rate of dry deposition of activity, V, and a cleansing factor, W, based on the activity in rain water. During the course of the period tested, V fell from 0.6 cm/sec to 0.4 cm/sec while the factor W was of the order of 1000 to 2000. These figures are given as examples of the way in which such equipment can be used to predict the long-term nuclear fallout on the earth's surface. Orig. art. has 1 figure and 2 graphs. 19, 15

Prague, Ceskoslovenska Farmacie, Vol 15, No 10, Dec 66, pp 531 - 532

Abstract: The authors describe the principle of the method, the apparatus used, and the kinds of ointments which can be used for this analytical method. For each kind of ointment a calibration curve is prepared and the results are read off this curve. An analysis can be made in 3 to 5 minutes. The accuracy of the method is $\pm 0.46\%$. 3 Figures, 4 Tables, 3 Czech references. (Manuscript received 1 Feb 66).

TITLE: Different responses to low intensity noise in man [This paper was presented at the Third Interdisciplinary Conference on Experimental and Clinical Study of Higher Nervous Functions held in Marianske Lazne from 19 to 23 October 1964.]

SOURCE: Activitas nervosa superior, v. 7, no. 2, 1965, 183

TOPIC TAGS: acoustic biologic effect, man, behavior pattern

ABSTRACT: 300 experiments with 14 volunteers in an environment with 35 dB and one with 45 dB with a frequency of 450 cycles are described. Motor coordination of automatic stereotype movements and a numerical test were used as criteria for the influence of noise. A deterioration at the higher noise level was noticed, but individual changes in performance were great. In the majority of cases, the increased noise improved the performance in the first 10 minutes, and then the detrimental influence of the noise manifested itself. The noise acts initially as a moderate excitatory factor. Orig. art. has: 1 figure. [JPRS]

Title : Advantages and Shortcomings of Regulation Systems

Orig Pub: Sklar a keramik, 1956, 6, No 9-10, 214-216

Abstract: Discussion of the advantages and shortcomings
of hydraulic, pneumatic and electric regulators.
In the opinion of the author the greatest number
of disadvantages are involved in the hydraulic
system, the pneumatic comes next, while the most
convenient but also the most costly is the elec-
tric system. In a number of instances it is
advantageous to use, in industry, a combined

 TITLE : Photometric Determination of Mercury

ORIG. PUB. : Pracovni lekar., 1958, 10, No 3, 250-253

ABSTRACT : The previously described method of determining Hg^{2+} , which is based on its catalytic action on velocity of the reaction of formation of a violet complex on the interaction of $K_4Fe(CN)_6$ and nitrobenzene (1) (RZhKhim, 1955, 5792), was investigated with the view of enhancing the accuracy of the results. The collected sample of air to be analyzed is boiled to remove excess Cl_2 or Br_2 (to absorb Hg from the air, chlorine-, or bromine water is used), diluted with water to 10 ml, pH is adjusted to 3.5, 1 is added, $K_4Fe(CN)_6$ is introduced at 25°, and after 90 minutes photometry is carried out in a 1-cm cell using a light filter with a maximum transmittance at 520-550 mμ. The

ORIG. PUB. :

ABSTRACT : method is suitable for determining $3.5 \cdot 10^{-8}$ to $5 \cdot 10^{-7}$ M Hg^{2+} . On determining 0.1-200 γ Hg in 15 ml solution the absolute error varies from ± 0.005 to $\pm 0.07\%$, and the relative error from ± 5 to $\pm 0.35\%$. From solutions containing large amounts of interfering ions (Cu , Ag , Au , Zn , Co , Al , Pb , Sn , Mn , Co , Ni , S^{2-} , PO_4^{3-} , CrO_4^{2-} , MnO_4^-) the Hg is first separated by electrolysis on Pt- or Au-electrode, and is then distilled in a current of hot gas. From ores and other solid inorganic products the Hg is isolated directly by distillation. -- T. Levi.
